Tropical Weather Awareness

Tropical Weather Outlook NWS National Hurricane Center Miami FL 800 AM EDT Sun Jun 18 2017

For the North Atlantic...Caribbean Sea and the Gulf of Mexico:

1. Showers and thunderstorms continue to show signs of organization in association with a tropical wave located about 1000 miles east-southeast of the southern Windward Islands. Some development of this system is possible during the next couple of days before environmental conditions become less favorable for tropical cyclone formation. This system is forecast to move to the west-northwest at near 20 mph toward the Windward Islands and northeastern South America during the next two days, and interests in these areas should monitor its progress. An Air Force Reserve Hurricane Hunter aircraft is scheduled to investigate this system on Monday, if necessary.
 1. Formation chance through 48 hours...medium...50 percent.
 2. Formation chance through 5 days...medium...50 percent.
2. A broad area of low pressure located over the northwestern Caribbean Sea continues to produce a large area of disorganized showers and thunderstorms. Gradual development of this system is expected while it moves slowly northwestward across the Yucatan Peninsula later today and over the southern or central Gulf of Mexico on Monday and Tuesday, where a tropical or subtropical cyclone is likely to form. Regardless of development, heavy rains are expected over portions of Central America, the Yucatan Peninsula, Jamaica, the Cayman Islands, and western Cuba during the next several days. An Air Force Reserve Hurricane Hunter aircraft is scheduled to investigate this system later today, if necessary.
 1. Formation chance through 48 hours...medium...60 percent.
 2. Formation chance through 5 days...high...90 percent.

Severe Weather Outlook Sunday, June 18, 2017

Hazardous Weather

Another hot one out there today. Heat indices are expected to rise above 100 degrees area-wide, with higher values across the southern Coastal Bend, roughly across the western halves of Kleberg and Nueces Counties and Jim Wells County. Values across those regions are expected to reach 110 to 114 degrees. If you have plans to be outside, remember to stay hydrated and wear light colored clothing. If traveling with children or pets today, always be sure to 'Look Before You Lock'.

Convection that developed yesterday evening across Kansas along/ahead of a cold front will affect parts of Eastern Oklahoma and Northern Arkansas. This activity may pose some isolated strong/gusty wind threat during the mid to late morning across the Arklatex and Southeast Oklahoma, before weakening by early afternoon. Isolated to scattered redevelopment along outflow from this morning convection and/or along the cold front will likely occur by mid afternoon and carry into the evening as heating and the moist low level airmass increase instability. Strong to locally damaging winds should be the main severe threat followed by hail in the stronger storm cores. There will be an isolated flash flood threat as well given the expected slow movement to the convection.
